

Philip Greco, III

📍 Tampa, FL ✉ philip.d.greco@gmail.com 🌐 philipgreco.com 📺 philip-greco 🗣 PDGIII

Summary

DevOps Engineer with experience designing, automating, and operating large-scale cloud and on-premises infrastructure across bare-metal Kubernetes and AWS EKS. Focused on container orchestration, infrastructure-as-code, CI/CD, secrets management, and observability.

Hands-on practitioner who applies production-grade patterns in personal projects, including a self-hosted Kubernetes homelab running the same tooling used at work.

Proven ability to deliver complex projects on time while building strong relationships across development, operations, and support teams.

Experience

Sangoma, Sr. DevOps Engineer

Tampa, FL

July 2025 – present

10 months

- Operate and maintain a large-scale UCaaS platform across bare-metal Kubernetes clusters and AWS EKS, supporting VoIP services including Asterisk, SIP, RTP proxy, and presence at scale.
- Migrated all manually-managed Kubernetes workloads to Helm and Helmfile, authoring custom charts and implementing a context guard to prevent accidental cross-cluster deployments.
- Led Kubernetes CNI migration to Calico via the Tigera Operator and managed Multus and Whereabouts for advanced multi-network pod configurations.
- Deployed and managed Istio service mesh across clusters, configuring PodDisruptionBudgets, traffic policies, and autoscaling.
- Provisioned and managed AWS EKS clusters using Terraform and Terragrunt, including EFS storage class migration, AWS Load Balancer Controller, pod identity for IAM, and VPC security group management.
- Deployed HashiCorp Vault cluster on AWS and integrated with External Secrets Operator across all environments, eliminating hardcoded secrets from Git.
- Built full observability stack on EKS using Prometheus, Grafana, Loki, and Alloy with both daemonset and sidecar logging patterns for platform services.
- Managed Kubernetes version upgrades across multiple clusters via Ansible playbooks incorporating pod health checks, DNS validation, and controlled rolling upgrades through v1.33.

Sangoma, DevOps Engineer

Atlanta, GA

Jan 2021 – July 2025

4 years 7 months

- Provisioned and managed bare-metal Dell blade infrastructure using PXE boot with Debian preseed automation, handling network interface configuration and OS deployment at scale.
- Authored and maintained Ansible roles to compile and deploy FreeSWITCH from source, managing version pinning, Sofia-SIP patches, debug symbol builds, and dependency management across environments.
- Managed SIP and global load balancer fleets via Ansible, maintaining version consistency and availability across production infrastructure.
- Monitored and maintained the UCaaS platform, performing root cause analysis on complex issues escalated by Tier 3 Support.
- Developed internal Bash and SQL tooling to streamline diagnostics and reduce mean time to resolution for support engineers.

Star2Star Communications, Lead Tier 3 Technician

Atlanta, GA

Jan 2016 – Jan 2021

5 years 1 month

- Diagnosed and resolved complex SIP/VoIP issues using Wireshark packet analysis, filing detailed bug reports with captures and reproduction steps to the development team.
- Collaborated with customers to correlate logs and packet captures, identifying platform-wide SIP issues and filing bug reports with development and DevOps teams for resolution.
- Authored technical documentation and contributed to Standard Operating Procedures to improve consistency across the support organization.
- Mentored junior technicians on SIP troubleshooting methodology and diagnostic tooling through regular training sessions.

Projects

Self-Hosted Kubernetes Homelab

- Designed and operate a bare-metal Kubernetes cluster managed entirely through Helmfile with declarative, dependency-ordered releases.
- Integrated HashiCorp Vault with External Secrets Operator using Kubernetes auth, providing dynamic secret injection across all namespaces without storing credentials in Git.
- Deployed Tailscale operator with custom ingress resources for zero-config HTTPS access to internal services without exposing ports to the internet.
- Built a full observability stack with Prometheus, Grafana, Loki, and Alloy for metrics, log aggregation, and alerting via Alertmanager.
- Provisioned Longhorn distributed block storage for stateful workloads and MetalLB for bare-metal load balancer support.
- Automated CI/CD for multiple services using GitHub Actions with self-hosted ARC runner scale sets deployed on the cluster, publishing container images to GHCR and deploying via Helm.

Self-Hosted LLM Inference & AI Automation

- Self-hosted Ollama on Kubernetes for fully local LLM inference, keeping all data on-premises with no dependency on external AI APIs.
- Built a RAG-style pipeline using ChromaDB as a vector database with Ollama-generated embeddings, enabling semantic similarity search across historical articles for context injection into prompts.
- Deployed as a Kubernetes CronJob with randomized scheduling jitter, concurrency controls, and ExternalSecrets Operator pulling credentials from HashiCorp Vault.

Education

BS Southern New Hampshire University, Information Technology

Manchester, NH

- Concentration: Networking & Telecommunications

Jan 2013 – Jan 2017

AS NHTI, Concord's Community College, Information Technology

Concord, NH

Jan 2011 – Jan 2013

Skills

Container & Orchestration: Kubernetes, Docker, EKS, Helm, Helmfile

Infrastructure as Code: Terraform, Terragrunt, Ansible

CI/CD: GitHub Actions, Actions Runner Controller (ARC), GHCR

Secrets & Security: HashiCorp Vault, External Secrets Operator, Kubernetes RBAC, Tailscale

Networking & Ingress: Traefik, MetalLB, NGINX, Wireguard, VoIP, TCP/IP, DNS

Observability: Prometheus, Grafana, Loki, Alloy, Alertmanager

Storage: Longhorn, AWS EFS, S3

Cloud & OS: AWS, Digital Ocean, Linux (Ubuntu, Debian)

AI & LLM: Ollama, ChromaDB, RAG

Languages: Bash, Python
